

Mini PC port map

THE SHORT VERSION

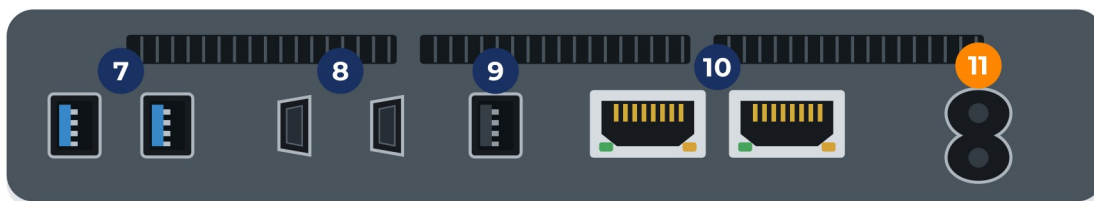

The front is for what you plug and unplug. The back is for what stays put. Monitors go into HDMI, keyboard and mouse into the slow rear USB, and drives into the blue front ports.

FRONT PANEL

- 1 USB 3.2** — blue inside, the fast one. Flash and backup drives.
- 2 Audio jack** — headphones, earbuds, desk speakers.
- 3 Clear CMOS pinhole** — a service button, not a port. Leave it alone.
- 4 USB-C** — plugs in either way up. Often carries video too.
- 5 Power button** — quick press on or sleep. Ten-second hold forces off.
- 6 Power light** — lit means running, dark means off.

REAR PANEL

- 7 Two USB 3.2** — printer, webcam, a drive that stays on the desk.
- 8 Two HDMI** — monitors or a TV, up to 4K at 60 Hz. Two screens, no adapter.
- 9 USB 2.0** — black inside and slower. Keyboard, mouse, dongles.
- 10 Two network ports** — one cable to the router. Either port works.
- 11 Power input** — use the adapter it came with. Barrel plugs from laptops and routers look identical and carry different voltage.

NO PICTURE ON THE SCREEN? WORK DOWN THIS LIST

- **Try the other HDMI port.** Five seconds, and it's often the whole fix.
- **Check the monitor's input.** Use its Source button to match the HDMI you used.
- **Push both cable ends in firmly.** HDMI backs out easily on a light machine.
- **Dark power light?** Reseat the adapter at the wall and at the machine.

NOT SURE WHAT GOES WHERE?

Bring it in with its cables and adapter. Most jobs are covered by our flat \$100 bench fee, and we call before anything costs more. We'll walk you through it for a small fee.
